

Xerox Disc Duplicators

“Drag & Drop” Feature

The Drag and Drop function works by connecting the Xerox Duplicator to a PC via a USB cable. Upon loading the Xerox Duplicator’s software pack onto the computer, the user will be able to recognize the Xerox Duplicator’s internal hard drive as another drive on the PC. Then the user can simply highlight the image files they want to transfer to the Xerox Duplicator’s hard drive and merely drag them over. Once the files have been placed in the duplicator’s hard drive, they will remain there until the user deletes them or overwrites them either through the duplicator itself or through the PC. The user can drag a single file or multiple files at once for ease of use and faster loading.

The standard method of loading projects into a duplicator’s hard drive is to create a master disc by burning the image files onto a CD or DVD first then loading them onto the hard drive one at a time through the duplicator’s reader drive. This process is far more time consuming and wasteful by creating multiple master copies when they are not needed. The Xerox Duplicator makes loading image files to the internal hard drive much faster and more convenient through the unique “Drag & Drop” function.
